

“Why Do Polliwogs Wiggle?” Class Draft

(Example, for Teacher Reference)

Polliwog is another word for tadpole, which is a baby frog. Polliwogs move by wiggling because they have no legs. Tadpoles have a mouth, tail, and gills and live in the water. Wiggling helps tadpoles to get around easily in the water. They wiggle their tails like a fish to move. Over many weeks, they grow legs and change into frogs, but until they do, wiggling is the best way to get around!
